HAZARDOUS WASTE SECTION

Attention: Mr. Jack Ellvinger

Dear Mr. Ellvinger:

Pursuant to 206.C.2.f of the New Mexico Hazardous Waste Regulations, certification is herein provided by Sparton Technology, Inc. that the three hazardous waste storage units described in our closure plan have been closed in general accordance with the Closure Plan dated December 19, 1985, as subsequently modified by the New Mexico Environmental Improvement Division in a letter to Sparton Technology, Inc., dated March 21, 1986, and as subsequently modified in three addenda dated October 15, 1986, November 10, 1986, and December 17, 1986.

This certification is based on the best efforts and knowledge of officers of Sparton Technology, Inc. Qualified contractors were selected to perform all phases of the closure activities. These contractors were required to perform in accordance to the Closure Plan, as referenced above. All closure activities were monitored by independent registered professional engineers qualified to perform such service. These engineers were familiar with the requirements of the Closure Plan and coordinated any significant adjustments to the plans and specifications with personnel of the EID Hazardous Waste Section. These adjustments are described in the above-referenced addenda to the Closure Plan.

The engineering firms retained by Sparton for contract inspection continuously observed all closure activities, and have provided certification that each hazardous waste storage unit was closed in general accordance with the Closure Plan as referenced above.

CERTIFICATION OF CLOSURE

Hazardous Waste Storage Surface Impoundments
Sparton Technology, Inc.
Coors Road Plant
Albuquerque, New Mexico

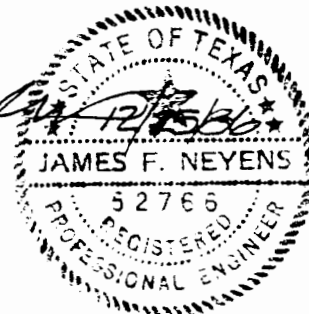

During the period November 3, 1986, through December 12, 1986, Cutler Repaving, Inc. of New Mexico, acting as a contractor to Sparton Technology, Inc., closed the two hazardous waste storage surface impoundments at the Coors Road facility. The surface impoundments had been used for the storage of aqueous plating wastes prior to off-site disposal. Residual liquid wastes had been removed prior to closure.

The closure consisted of reducing the surface impoundment walls and backfilling. The area was then graded and proof-rolled in preparation of the subgrade for an asphaltic concrete cap. During preparation of the subgrade, the old solvent sump (as described in the closure plan) was completely removed for disposal off site as a hazardous waste. Following installation of the asphaltic concrete cap and drainage swale, the security fence was reinstalled.

All of the above work was monitored on a continuous basis by representatives of Harding Lawson Associates and Metric Corporation, acting as a subcontractor to Harding Lawson Associates. Based on the observations thus obtained, it is the professional opinion of the undersigned that the hazardous waste storage surface impoundment area was closed in general accordance with the closure plan dated December 19, 1985, as subsequently modified by the New Mexico Environmental Improvement Division in a letter addressed to Sparton Technology, Inc., dated March 21, 1986, and as subsequently modified in two addenda dated October 15, 1986, and November 10, 1986, respectively.
